LabelsAnywhere.com Security

Some customers have questions about data security in LabelsAnywhere.com. Following is an explanation of the operations of the software that will help alleviate any concerns about security matters.

While LabelsAnywhere is a web-based product, all of your data resides safely on your computer and is never sent across the Internet. All data that gets entered into the LabelsAnywhere grid for printing on labels never leaves your computer and is stored only in your local temporary internet files (cache). In fact, the only information that gets passed over the internet consists of: your LabelsAnywhere login and password, your label template (which is then stored in your local cache), and label inventory information. You can even choose to delete your temporary internet files at the end of a LabelsAnywhere session to ensure ultimate data security.

Regarding network security: LabelsAnywhere is designed for use in most environments; however your network security must handle these settings: allow a VeriSign™ ActiveX control, have JavaScript™ enabled, and have cookies enabled.

Hopefully this explanation of the LabelsAnywhere product helps answer any questions you may have about data security. If you should have any other questions or need clarification on anything discussed in this document, contact Colorflex Technical Support at 800-424-3375.
